GENERAL INFORMATION:

APPLICANT: Daggett, Lorrie P.

APPLICANT: Daggett, Lorrie P.

APPLICANT: Daggett, Lorrie P.

APPLICANT: Daggett, Lorrie P.

TITLE OF INVENTION: SUBUNITS, NUCLEIC ACIDS ENCODING SAME AND USES THEREFOR INVENER OF SEQUENCES: 63

CORRESPONDENCE ADDRESS:

ADDRESSEE: Heller Ehrman White & McAuliffe

STREET: 4250 Executive Square, 7th Floor

CITY: La Jolla
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1;

                                                                                                                        Sequence 10, Application US/08436332B
Patent No. 6130058
GENERAL INFORMATION:
APPLICANT: LE BOUNDELLES, BEATRICE
APPLICANT: MHITING, PAUL JOHN
TITLE OF INVENTION: STABLY TRANSFECTED CELL LINE EXPRESSING
TITLE OF INVENTION: RECEPTORS, AND NOVEL CLONED NMDA
TITLE OF INVENTION: RECEPTOR SUBUNIT SEQUENCES
NUMBER OF SEQUENCES: 21
CORRESPONDENCE ADDRESS:
ADDRESSEE: MICHAEL D. YABLONSKY - MERCK & CO., INC.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           E: MICHAEL D. YABLONSKY - MERCK & CO., INC.

 -1- SIMILARITY: Belongs to the disease resistance NB-LRR family.
-1- SIMILARITY: Contains 6 leucine-rich (LRR) repeats.
-1- SIMILARITY: Contains 1 NB-ARC domain.
-1- DATABASE: NAME-NIB-LRRS.
-1- DATABASE: NAME-NIB-LRRS.
 -i-FUNCTION: Disease resistance (R) protein that specifically recognizes the AvrRpt2 type III effector avirulence protein from Pseudomonas syringae. Resistance proteins guard the plant against pathogens that contain an appropriate avirulence protein via an indirect interaction with this avirulence protein. That triggers a defense system including the hypersensitive response, which restricts the pathogen growth. Acts via its interaction with RIN4, and probably triggers the plant resistance when RIN4 is degraded
 At4g26090.

 ö
CATALYTIC ACTIVITY: N deoxynucleoside triphosphate = N diphosphate
+ {DNA}(N).
 PTM: This protein undergoes a protein self splicing that involves a post-translational excision of the three intervening regions (inteins) followed by peptide ligation.
SIMILARITY: Belongs to the DNA polymerase type-B family.

 The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein Ps (MOMP Ps) of non-typeable H. influenzae (htHi). Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP Ps from strain ntHill138, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of Ps and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus
 Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis

 The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS; (MOMP PS) of non-typeable H. influenzae (htth). Bach of these peptides contain an LB1() peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argll7 to Gly13. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
 Hyperblebbing; Gram-negative bacterium; genetically modified; Tol gene; peptidoglycan-binding; peptidoglycan-associated site; outer-membrane; bacterial infection; vesicle-shedding; Bleb; filter sterilised; detergent; deoxycholate; homogeneity; antibacterial; vaccine; HiRD; PS; P6; PCP.
 Novel hyperblebbing Gram-negative bacterium that has been genetically modified by down-regulating expression of Tol genes, and/or attenuating peptidoglycan-binding activity useful for treating bacterial infection.
 Gaps
 Recombinant bacterial outer membrane protein where one or more surface exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media and conjunctivitis:

The present invention relates to a new hyperblebbing Gram-negative bacterium genetically modified by one or more processes selected from down-regulating expression of one or more Tol genes and attenuating the peptidoglycan-binding activity by mutation of one or more gene (s) encoding a protein comprising a peptidoglycan-associated site. The invention is useful in a method of treatment of the human or animal body. The invention is useful in a method of treatment of the human or animal body. The invention and also useful for protecting an individual against a bacterial infection. The invention has improved outer-membrane vesicles shedding properties. Blebs are more easily made in higher yield from the invention, and are more homogeneous in nature and can be more readily filter sterilised. The blebs can be made and harvested without the use of detergents such as deoxycholate, thus obviating chromatography clitter sterilised. The blebs can be made and harvested from the invention have reduced particle size (allowing sterile filtration through 0.22 mum pores), increased batch homogeneity, and a superior yield. The packet in the invention acid aequence represents a Haemophilus influenzae protein,

 Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
 The present invention describes antigenic FS-like fimbrin subunit peptides (IB1(f) peptides) of FS-like fimbrin proteins from various Haemophilus influenzes strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as octifus media, sinusitia, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. sifluenzae. Antibodies and probes from the present invention can be used

 Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
 The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. ANT79955 to ANT9933, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of

ö
 The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABB57737-ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
 New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
 the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding
 Antisense; prokaryotic essential gene; cell proliferation; drug design.

 The present invention describes a recombinant mutant Archeal DNA polymerase exhibiting an increased reverse transcriptase activity, where the wild-type form comprises an amino acid sequence selected from the 12 fully defined sequences comprising 586-1829 amino acids of SEQ ID No:1-23 (odd numbers only). Also described: (1) a chimeric polypeptide comprising the mutant Archeal DNA polymerase and a second polypeptide fused to the mutant Archeal DNA polymerase and isolated polynucleotide encoding: (a) the mutant Archeal DNA polymerase which exhibits an increased reverse transcriptase activity, compared to a DNA polymerase encoded by a wild-
 Thermostable DNA polymerase from Thermococcus sp. TY - useful for nucleic
 The present sequence (TYPO1 Intron) is a Thermococcus sp. TY (DSM 10597) thermostable DNA polymerase with 3'-5' exonuclease activity. The enzyme can specifically amplify nucleic acid fragments of up to 5 kb in high yields, has an activity half-life of 20 minutes at 90 degrees C, has an optimum temperature of 70-80 degrees C, has an optimum pH of 7.5, exhibits optimum activity at a KCl concentration of 80-100 mM, is magnesium ion-dependent and is inhibited by manganese ions
 New recombinant mutant Archeal DNA polymerase exhibiting an increased reverse transcriptase activity, useful for reverse transcribing an RNA template into cDNA or for amplifying an RNA template.

The invention relates to constructing (M1) a strain of diploid fungal cells in which both alleles of a gene are modified, comprising modifying cells in which both alleles of a gene are modified, comprising modifying one allele by insertion or replacement by a cassette having an expressible selectable marker and modifying other allele by insertions.

Concentration, of a promoter replacement fragment with a heterologous promoter, so that expression of the second allele is regulated by the promoter. (M1) is useful for constructing a strain of diploid fungal cells having both alleles modified are useful for identifying a gene that is essential to the survival or growth of a fungus, a gene that contributes to the virulence and/or pathogenicity of a fungus, a gene that contributes to the resistance of a diploid fungus to an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian agent, an antifungal agent that inhibits the growth of a diploid fungus and for identifying a therapeutic agent for treatment of a mammalian agent, an attitudgal agent that inhibits the growth of a diploid fungus and for identifying a compound which modulates the activity of a gene product, preferably enzymatic activity, carbon compound catabolism, blosynthetic, transporter, transcriptional, compound stabolism, blosynthetic, transporter, transcriptional, aginal transduction, DNA replication and cell division activity. The method is useful for identifying a compound having the ability to inhibit growth or proliferation of C. albicans cells and for treating infection by C. albicans. The present sequence is that of an essential candida albicans protein used in the method of the invention. Note: The sequence data for this patent is not represented in the printed specification but is based on sequence information supplied to Derwent by

 This invention relates to a novel method for altering one or more plant characteristics. Specifically, it refers to identifying genes that are up characteristics. Specifically, it refers to identifying genes that are up care of whar-regulated in transgenic plants overexpressing the heterodimeric step land factor of Arbidopsis and using these sequences to alter plant characteristics accordingly. The present invention describes generating transgenic plants for the production of growth regulators, c enzymes, therapeutics, pharmaceuticals and animal feed products, where the altered plant characteristics are selected from increased yield or biomass, enhanced survival capacity, stress tolerance, plant architecture or physiology, altered endoraduplication, biochemistry, signal transduction, storage lipid mobilisation and/or altered photosynthesis, each relative to the corresponding wild type plants. Accordingly, these each relative to the useful as positive or negative selectable markers during transformation of cells or tissues. The identified genes play a cole in a variety of biological processes such as DNA replication, cell wall blosynthesis, itrogen and/ or carbon metabolism or they function as transcription factors. This polypeptide sequence is thale cress protein expressed by a gene represed 1.3 fold or more in plants oversypressing the EZFA/DPa transcription factor, given in an exemplification of the

 nucleotide sequence selected from one of 1680 sequences, a mature purper coding portion of them, an active domain of them and their complementary sequences. The invention may be useful for the production of compounds with an antiarthritic, antiparkinsonian, neuroprotective, nootropic, immunosuppressive, cytostatic, antipsoriatic, antiparastic activity. In addition, the disclosed sequences may be useful for gene therapy. The polypeptides or their antibodies are useful for treating many diseases such as arthritis, Parkinson's, Alzheimer's, autoimmune diseases, cancer, psoriasis, inflammatory bowel disease and infections caused by bacteria, viruses, fungi or parasites. The present sequence is that of a human polypeptide of the invention.

 disorder
 à
 The present sequence is that of Comamonas (formerly Pseudomonas) sp. NCIMB 9872 cyclopentanone 1,2-monoxygenase (CPMO), as deduced from an isolated genomic DNA fragment (see ARA91715). CPMO carries out the second step of a degradation pathway that allows Comamonas sp. NCIMB 9872 to use cyclopentanol as a sole C-source for growth. CPMO protein (mol.wt. 62,111) shows 36.5% homonology with the cyclohexanone 1,2-monoxygenase of Acinecobacter sp. NCIMB 9871. It was expressed in Escherichia coli as an IPTG-inducible protein. Isolated CPMO DNA, recombinant expression rectors, especially plasmids and viral DNA vectors, transformed cells, especially plasmids and viral DNA vectors, transformed cells, especially be coli, purified CPMO, recombinant CPMO and a method for growing cells in vitro in the presence of cyclopentanol or cyclopentanone construct encoding enzymatically active CPMO, are all claimed. (Updated on 29-AUG-2003 to standardise OS field)
 ô
 Novel cyclopentanone monooxygenase from Comamonas having increased enzymatic activity for growing cells in a medium containing cyclopentanol or cyclopentanone as sole carbon source.

 The invention relates to multiprotein complexes from eukaryotes. Proteins of the invention and DNA sequences encoding them are given in records ABR52566-ABR53903 and ACC60610-ACC6194 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on decument is available on CD-ROM

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
 The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX719955 to AAX77993, and AAS91201 to AAZ91252, represent sequences used in the exemplification of the present invention
 Vaccine, non-typeable Haemophilus influenzae; ntHi; infection;
chimeric protein; Haemophilus influenzae; P5-like fimbrin protein;
lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis;
conjunctivitis, lower respiratory tract infection.

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
 The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various statemental singlenares extrains. The peptides are used for diagnosis, prevention, and treatment of Heamophilus influenare infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenare. The peptides may also be used in vaccines against H. influenare. Antibodies and probes from the present invention can be used for diagnosis of H. influenare infection. ANY19955 to ANY19933, and AAX31201 to AAX31252, represent sequences used in the exemplification of

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                         The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS (MOMP PS) of non-typeable H. influenzae (nthl). Each of these peptides contain an LBI(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain nthill28, representing amino acids Argl17 to Glyl35. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Hemophilus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                             Recombinant bacterial outer membrane protein where one or more surface exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                    influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Length 31;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane brotein PS; (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LBI(E) peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argl17 to Glyl35. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native envixonment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Heemophilus
                                                                                                                                                                                                                                                                                                 Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The present invention describes antigenic P5-like fimbrin subunit peptides (LB) (f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. Affluenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV719955 to AAV719993, and AAZ91201 to AAZ91202, represent sequences used in the exemplification of the present invention
                                                                  otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzea. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV79955 to AAX79993, and AAS91201 to AAZ91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             antigenic P5-like fimbrin subunit peptides used in vaccines against

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              peptides (LBI(f) peptides) of P5-like fimbrin proteins from various haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. Influenzae, Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV79955 to AAV79933, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                     Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                      The present invention describes antigenic P5-like fimbrin subunit peptides (LBL(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. Influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX719955 to AAX71993, and AAX91201 to AAX91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Vaccine, non-typeable Haemophilus influenzae, ntHi; infection; chimeric protein; Haemophilus influenzae; PS-like fimbrin protein; Ilpoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Non-typeable H. influenzae group 2 LB1(f) peptide N1236MBE.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. influenzae and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vaccine, non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein, Haemophilus influenzae, P5-like fimbrin protein, lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.

The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. influenzae and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAZ91201 to AAZ91262, represent sequences used in the exemplification of the present invention

                      The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such prevention, and treatment of Haemophilus influenzae infections, such

The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 1;
                                                                                                                                                                                                                                                                                                                                                                                                The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LBI(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argl17 to G1/13. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                    Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis

The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein Ps; (MOMP Ps) of non-typeable H. influenzae (ntHi). Bach of these peptides contain an LBI(f) peptide which is a 19 amino acid peptide derived from the sequence of WOMP Ps from strain ntHill28, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of Ps and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP Ps may be used to influence response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hyperblebbing; Gram-negative bacterium; genetically modified; Tol gene; peptidoglycan-binding; peptidoglycan-associated site; outer-membrane; bacterial infection; vesicle-shedding; Bleb; filter sterilised; detergent; deoxycholate; homogeneity; antibacterial; vaccine; HiRD; PS; P6; PCP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Recombinant bacterial outer membrane protein where one or more surface-
exposed loops are modified is useful as a vaccine to prevent or treat
Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gaps

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ð
                                                                                                                                                                 The present invention relates to a new hyperblebbing Gram-negative bacterium genetically modified by one or more processes selected from down-regulating expression of one or more Tol genes and attenuating the peptidoglycan-binding activity by mutation of one or more gene(s) encoding a protein comprising a peptidoglycan-associated site. The invention is useful in a method of treatment of the human or animal body. The invention is also useful for protecting an individual against a bacterial infection. The invention has improved outer-membrane vesicles shedding properties. Blebs are more easily made in higher yield from the invention, and are more honogeneous in nature and can be more readily filter sterilised. The blebs can be made and harvested without the use of detergents such as deoxycholate, thus obviating chromatography filter sterilised. The blebs is not steps. Vesicles prepared from the invention have reduced particle size (allowing sterile filtration through or a mum pores), increased batch homogeneity, and a superior yield. The present amino acid sequence represents a Haemophilus influenzae protein,
                                                                                                                                                                                                                                                                                                                                                                                                                                          1;
                                                                                             Novel hyperblebbing Gram-negative bacterium that has been genetically modified by down-regulating expression of Tol genes, and/or attenuating peptidoglycan-binding activity useful for treating bacterial infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps

One or more surface exposed loops of this protein may be replaced with a modified peptide of the invention. Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP P5 from strain ntHill28, representing amino acids Argll7 to Glyl35. This peptide represents the third exposed loop of P5 and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP P5 may be used to induce an immune response in a mammal to prevent or treat Haemophilus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis

```
the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense colly (2) a host cell containing the vector; (3) an isolated or its fragment whose expression is inhibited by the antisense collypeptide or its fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (5) producing the polypeptide; (6) inhibiting cellular confideration or the activity of a gene in an operon required for proliferation, (7) identifying a cactivity of a gene in an operon required for cellular proliferation or the activity of confideration. (7) identifying a cactivity against a biological pathway in which a proliferation for cellular proliferation of the pathway in which a proliferation for cellular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound; a activity; (11) a culture compitating strains in which the gene product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of proliferation of an organism. The antisense nucleic acids required for proliferation of an organism. The antisense nucleic acids required for proliferation of sereening for homologous nucleic acids required for proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation and not solate candidate molecules for rational corrections of the target prokaryotic essential genes. Note: The sequence data for this patent of the printed specification, but was obtained in a lorror, when a proper specification, and the present as equence of the printed specification.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               gene disruption; gene targeting; marker gene; transformation; homologous recombination; hyperthermostable archaebacterium; KOD1; gene structure; gene function; enzyme activity; medicine; forensic science; food; drug inspection; molecular biology; immunology

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Ĥ
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                   Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                               The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ91202, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to an isolated nucleic acid comprising any one of

This invention relates to a novel method for targeting disruption of an arbitrary gene in a genome of an organism which comprises providing the whole sequential data of the genome of such organism, selecting at least I arbitrary region in the sequence, providing a vector that contains a sequence homologous with the selected region and a marker gene, transformation, and homologous recombination. The genome is preferably the genome of a hyperthermostable archaebacterium, particularly thermococcus kodakaraensis KODI. The method is for targeting the Thermococcus kodakaraensis KODI. The method is for targeting the disruption of a gene in the genome of an organism, which is applicable in studying gene structure and functions as well as enzyme activities of encoded proteins and useful in medicine, forensic science, food or drug inspection, molecular biology and immunology. With this method, the accorded by the genome of Thermococcus kodakaraensis which was derived efficiently and reliably. The present sequence is that of a protein encoded by the genome of Thermococcus kodakaraensis which was derived to an in a general did not form part of the printed specification, but was obtained in electronic format directly from WIPO at the present sequence at a for this fip. wipo.int/pub/published_pct_sequences

```
The invention relates to a novel urinary specific nucleic acid molecule (USNA). A protein encoded by a USNA of the invention has cytostatic activity. The USNA may have a use in gene therapy, and as a vaccine.

These nucleic acids and polypeptides are also useful for diagnosing and monitoring the presence and metastases of urinary cancer in a patient. The artibody that specifically binds to the lung specific polypeptide is useful for determining the presence of a urinary specific protein in a sample, as well as for treating a patient with cancer, particularly by inducting an immune response against the urinary cancer cell expressing the urinary specific genes and proteins are useful for identifying, these urinary specific genes and proteins are useful for identifying, diagnosing, maniforing, imaging and treating urinary cancer (e.g. squamous cell carcinoma) and non-cancerous disease states in the urinary. The sequences shown in ADD71534-ADD71716 represent urinary
          The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA sequences (ABL16176-ABL30511), expressed DNA sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         New urinary specific genes and proteins, useful in gene therapy or as vaccines for treating urinary cancer or non-cancerous urinary diseases, as well as for diagnosing, monitoring or staging such diseases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        human; urinary specific nucleic acid; USNA; cytostatic; gene therapy; vaccine; urinary cancer; urinary specific protein; USP; cancer; squamous cell carcinoma.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            This sequence represents a cytochrome P450 protein, CYP94A6, of tobacco that is expected to have fatty acid hydroxylase activity since is displays the characteristic signature motif for this class of enzymes.

The invention provides isolated mucleic acids (see AAX58400-06) encoding plant fatty acid hydroxylases (see AAY05896-902). Also claimed are host cells, transpanic plants and compositions consisting of the plant fatty acid hydroxylase, a process for isolating additional fatty acid hydroxylase genes from a plant, and a process of altering fatty acid hydroxylase genes from a plant by expressing the plant fatty acid hydroxylase in a plant by expressing the plant fatty acid dydroxylase in a plant by expressing the plant fatty acid content composition in a plant by expressing the hydroxylated fatty acid content of plants will modify resistence to drought and attack by insects and content peats. The transgenic plants may also be used as sources of hydroxylated and epoxidized fatty acids useful in the manufacture of e.g. lubricants, anti-slip agents, plasticisers, coating agents, detergents
                                                                                                    ;
                                                                                                                                                                                                                                                                                                                                                                              Fatty acid omega-hydroxylase; cytochrome P450; transgenic plant; lipid; hydroxylation; epoxidation; oilseed; vegetable oil; crop protection; omega-hydroxy acid; CYP94A6; tobacco.

The present invention describes proteins and their fragments (I) encoded by chromosome 2 of the human malarial parasite, plasmodium falciparum. Chance described are: (I) nucleotide sequences (II) encoding (I); and (2) vaccines against P. falciparum infection comprising (I) or (II). (I) and polyclonal antisers or a monoclonal antised to infection. (I) and polyclonal antisers or a monoclonal antised to immunogens comprising the sequences of (I), are useful in the detection of infection with P. falciparum. Furthermore, (I) (especially when they are rifins or secreted or membrane proteins) can aid the identification of drugs to treat or prevent P. falciparum infection, or they can be used to identify drug resistance in P. falciparum. Sequencing of the conformation of the subsequent identification of proteins concoded by it will help to expand our understanding of parasite biology, a process hampered by the complexity of the parasitic lifecycle, and concoded by the complexity of the parasitic lifecycle, and concoded help and mosquito resistance to insecticides have led to a resurgence of malaria in many parts of the world, and there is a pressing need for concoder and and analysis parts of the world, and there is a pressing need for concoder and and analysis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Antisense; prokaryotic essential gene; cell proliferation; drug design.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Proteins encoded by chromosome 2 of the human malarial parasite, Plasmodium falciparum, useful as antimalarial vaccines and in the diagnosis of P.falciparum infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    represent nucleotide and protein sequences given in the present
invention, but which are not specifically mentioned within the
antimalarial; malaria; protozoacide; infection; insecticide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Score 46; DB 3; Length 332; Pred.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention relates to a novel isolated polynucleic acid segment modulated within a cell by posttranscriptional gene silencing (PTGS). The invention specifically relates to a method to identify an expression product that is modulated by PTGS. The polynucleotide is useful for modulating the gene expression within a cell by PTGS, by introducing the polynucleic acid into a cell and expressing the nucleic acid segment in the cell to form a product. The polynucleic acid segment is also useful for augmenting a cell and expressing the nucleic acid segment in the call contacting a plant cell with the segment to produce a transformed plant cell, and growing the transformed plant cell to produce a differentiated transformed plant. The sequences shown in ABPS1173 - ABPS1298 represent the product of a segment of A. thaliana cDNA modulated by PTGS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Novel polynucleic acid segment useful for modulating gene expression within a cell by posttranscriptional gene silencing, and for augmenting plant cell genome.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Plasmodium falciparum; chromosome 2; human malaria parasite; vaccine;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

The invention relates to new Proteus mirabilis polypeptides and polymucleotides. The invention also relates to antibodies against the polymetides, methods for producing the polypeptides, method of generating vaccines for immunishing an individual against P. mirabilis, a method for evaluating a compound for the ability to bind a P. mirabilis, a polypeptide and a method for screening test compounds for anti-bacterial activity. The polypeptides and polymucleotides are useful as molecular targets for diagnosing, preventing and treating pathological conditions resulting from bacterial infection, as reagents for diagnosis of bacterial diseases, as components of antibacterial vaccines, as targets for antibacterial drugs or as bio-control agents for plants. This sequence represents a Proteus mirabilis polypeptide of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Intronic region; taxonomy; mitochondria; eukaryote; fungus; protozoa; intron polymorphism analysis; cytochrome oxidase subunit 1; Cox1; Cox2;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to an isolated nucleic acid comprising any one of the foll antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell. Also included are:

(1) a vector comprising a promoter operably linked to the nucleic acid nucleic acid; (2) a host cell containing the vector; (3) an isolated or utsers fragment whose expression is inhibited by the antisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide or its fragment whose expression is inhibiting cellular proliferation or the activity of a gene in an operon required for proliferation or the activity of a gene in an operon required for the gene product or that has an activity against a biological pathway required for proliferation, or that inhibits cellular proliferation; (8) identifying a gene required for cellular proliferation or the biological pathway required for proliferation. Or that inhibits epular proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound that inhibits proliferation of an organism acts; (9) manufacturing an antibiotic; (10) profiling a compound sectivity; (11) a culture compound that inhibits proliferation of an organism; is present in a culture or collection of the which each of the strains is present in a culture or collection of product is overexpressed or underexpressed; (12) determining the extent to which each of the strains is present in a culture or collection of a proliferation of an organism. The antisense nucleic acids are useful for dentifying proteins or servening for homologous nucleic acids required for cellular proliferation to isolate enadidate molecules for rational and dentifying proteins or servening and promoter and dentifying proteins or servening to homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      screening
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. typhimurium, K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at fixed by wipo.int/pub/published_pct_sequences

The invention relates to constructing a profile of intronic regions (IRB) from a given taxonomic group of organisms, useful for characterizing target organisms. The method comprises (a) selecting an IR known to be found in some or all members of the taxonomic group; (b) analyzing IR of known members of the taxonomic group; The target organism includes IR characteristic from the taxonomic group. The target organism includes cukaryotes, fungl, in particular Candida or Aspergillus and is suspected of belonging to a smaller taxonomic group than the given taxonomic group. Characterizing a target organism is useful for diagnosing the presence of any organism that contains DNA including fungi, protezoan and other any organism that contains DNA including fungi, protezoan and other members of the animal and plant kingdom. Fungi suitable for detection by intron polymorphism analysis include Candida, Aspergillus, Cryptococcus, Blastomyces for clinical applications and Fusarium, Tilletia and Botrytis for non-clinical applications. The method is rapid and accurate in ceading frame sequence of a cytochrome oxidase subunit 1 (Cox1) intron relating indica

The invention relates to a method of screening an agent which comprises a nucleic acid coding for a protein that effects intronic region-encoded protein (IRRP)-mediated post-transcriptional processing of RNA. The method involves providing the protein in an assay format adapted for studying the effects of the protein on post-transcriptional processing of pre-mRNA and assaying for the effects in the presence of the agent. The method is useful for producing a composition comprising an agent that modulates IRRP-mediated post-transcriptional processing of RNA for inhibiting growth of a non-human organism, particularly fungus, that is associated with a host organism. The invention is also useful in gene therapy. The present sequence is Tilletia indica cytochrome oxidase subunit 1 (cox1) IRRP protein. This sequence is used to illustrate the method of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Bax; Bax-resistance; cytostatic; fungicide; immunosuppressive; virucide; vasotroplic; vaccine; gene therapy; proliferative disorder; cancer; apoptosis; fungal; yeast; infection; autoimmune disease; ischaemia; neurodegeneration; cell death.

This invention describes a novel nucleic acid representing a synthetic Bax gene. The Bax gene of the invention is useful for identifying Baxresistant yeast or fungi, identifying, or obtaining and identifying Baxcandida spp. sequences that are differentially expressed in a pathway candida spp. sequences that are differentially expressed in a pathway inhibitor sequences of Bax-induced cell death or identifying inhibitors or inhibitors equences of Bax-induced cell death. The products of the invention have cytostatic, fungicide; immunosuppressive, virucide and vasotropic activity and can be used in vaccines or for gene therapy. The invention have cytostatic, phypeptides, playpeptides, playpeptides, playpeptides, playman are useful as medicament for treating, preventing and/or alleviating preparing a medicament for treating, preventing and/or alleviating as cancer, or for preventing apoptosis in certain disease. The compounds or preparing a medicament for modifying the endogenic flora of humans and cother mammals. The vaccine is useful for immunising against yeast or ingraman, diseases related diseases include autoimmune disease, ischaemia, diseases related with viral infections or neurodegenerations. This sequence represents a polypeptide associated with the Bax gene described in the disclosure of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ï
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Streptococcus, GAS; GBS; group B streptococcus; Streptococcus agalactiae; group A streptococcus; Streptococcus pyogenes; antibacterial; antinflammatory; infection; vaccine; meningitis; gene therapy.
New isolated nucleic acid representing a synthetic BAX-gene, useful as medicament for treating, preventing and/or alleviating yeast or fungal infections or proliferative disorders, or for preventing apoptosis in

The protein may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypebtide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine development, the amino acid sequences predicted from various ORF were
               The present sequence is a Helicobacter pylori protein, which may be used in a vaccine to prevent or treat H. pylori infection or to identify H. pylori polypeptide binding compounds, useful as potential H. pylori life cycle activators or inhibitors. The genomic sequence of H. pylori (ATCC 55679) was determined from overlapping contigs generated by mechanically shearing the bacterial DNA. The sequences were analysed for ORF of at least 180 nucleotides, and the predicted coding regions defined by computer evaluation. To identify likely H. pylori antigens for vaccine analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification

reaction (PCR) primers, oligomers, and for chromosome and gene mapping, reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II) The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed cand in recombinant production of (II) The polynucleotides are also used in diagnostics as expressed sequence tags for identifying expressed can be compared to the compared of (II) or to treat disease states involving (II). (II) is useful for generating antibodies against it, detecting or quantitating a polyneptide in tissue, as molecular weight markers and as a food supporting in tissue, as molecular weight markers and as a food supporting in its bill and its binding partners are useful in medical imaging of stees expressing (II). (II) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polynucleotide sequences have applications in capportics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and canno acid sequences. Abgooulo-Abgish77 represent novel human diagnostic maino acid sequences Abgooulo-Abgish77 represent novel human diagnostic maino acid sequences of the invention. Note: The sequence data for this patent did not appear in the printed specification, but was obtained in
                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  invention relates to isolated polynucleotide (I) and polypeptide (II)
analysed for significant homology to other known or exported membrane proteins. Having identified and determined the sequences of interest, particular regions can be isolated from H. pylori by PCR amplification for recombinant polypeptide production, e.g. in E. coli hosts
                                                                                                                                                                                                    Gape
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New isolated polynucleotide and encoded polypeptides, useful in diagnostics, forensics, gene mapping, identification of mutations responsible for genetic disorders or other traits and to assess
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Human; chromosome mapping; gene mapping; gene therapy; forensic; food supplement; medical imaging; diagnostic; genetic disorder.

The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention is useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABL16176-ABL30511), expressed DNA ABB72072). The sequence data for this patent did not form part of printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New isolated nucleic acid detection reagent for detecting 1000 or more genes from Drosophila and for elucidating cell signaling and cell-cell

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The invention relates to isolated Acinetobacter baumannii nucleic acids. The A. baumannii nucleic acids and polypeptides are useful as reagents for disgnosing a bacterial disease, as components of antibacterial vaccines, as targets for antibacterial drugs, to detect the presence of the baumannii and other Acinetobacter species in a sample, in screening compounds for the ability to interfer with the A. baumannii life cycle or to inhibit A. baumannii infection, and as biocontrol aspents for plants. The present sequence represents the amino acid sequence of an A.

This represents a novel human secreted protein (MHP) that share structural similarity with animal ceruloplasmins. MHP oligonucleotides are useful as hybridization probes for screening libraries and assessing gene expression patterns. Sequences derived from regions adjacent to the intron/exon boundaries of NHP gene can be used to design primers for use in amplification assays to detect mutations within the exons, splice in amplification assays to detect mutations within the exons, splice centered introns that can be used in diagnostics and pharmacogenomics. MHP mucleotide sequences are useful for drug screening and nucleotide construct encoding NHP products are useful in gene therapy for modulating NHP expression and to product a genetically engineered host cells to express NHP products in vivo. NHP products e.g. NHP fusion protein products, NHP antibodies and antegonists or agonists are useful as therapeutics i.e., for the treatment of Wilson's disease. The encoded NHP colyppetides are useful for generating antibodies, as reagents in diagnostic assays, for identifying other cellular gene products related to NHP and as reagents in assays for screening for compounds that are useful in the treatment of mental, biological or medical disorders and
                                                                                                                                                                                                                                                                                                                                                                                                                                          structural similarity with animal ceruloplasmins, useful for drug
screening, diagnosis and treatment of biological disorders or imbalances.
                                                                                                                                                                                                                                                                                                                                                                                                                   polynucleotides encoding human secreted proteins that share

Human secreted protein SCEP-4.

ö

Gaps

The invention describes an isolated polypeptide chosen from secreted proteins (1), SECP 1-54. (1) and the polynucleotide encoding it (II) are useful for screening a compound for effectiveness as an agonist or antagonist of (I) or compound that alters expression of [II]. (I). the identified agonist and antagonist are useful for treating a disease or condition associated altered expression of functional SECP in a patient. An antibody specific to (I) is useful for detecting the presence of (I), purifying (I) from a sample and for diagnosing a condition or disease casociated with expression of SECP in a subject or in a biological sample. (I) and (II) and modulators of (I) are useful for diagnosis, treatment and prevention of call proliferative disorders (e.g. cancer, keratosis, autoimmune/inflammatory disorders (e.g. acquired psoriasis), autoimmune/inflammatory disorders (e.g. acquired psoriasis), autoimmune/inflammatory disorders (e.g. acquired throughtis, crohn's disease, altergies, asthma, osteoporosis, autoimmune, archivitis, activitis, adabetes, Graves' disease, potential, fungal, parasaltic, processal, helminthic infections and cromanic sclerosis, ulcerative colitis, haemodialysis, uveitis; viral, captermic sclerosis, ulcerative colitis, haemodialysis, uveitis; viral, contained and disorders (e.g. congestive heart failure, angina, hybertensive heart disease, amyotrophic lateral sclerosis, epilapsy, stroke, Huntington's disease, multiple sclerosis, dementia, neuromuscular disorders, metabolic, endocrine and toxic myopathies, mental disorders, and and evelopment allower, hearing loss and and and evelopment allower, harding and and evelopment allower, harding and and evelopment allower, and and evelopment allower. epilepsy, hypothyroidism, glaucoma, sensorineural hearing loss and cataract). (II) is useful for creating transgenic animals to model human disease and to detect and quantify gene expression in biopsied tissues in which expression of SECP is correlated with disease. This is the amino acid sequence of a human secreted protein (SCEP) cardiovascular disorder; congestive heart failure; angina; epilepsy; hypertensive heart disease; neurological disorder; Alzheimer's disease; Parkinson's disease; amyotrophic lateral sclerosis; stroke; dementia; Huntington's disease; multiple sclerosis; neuromuscular disorder; metabolic disorder; endocrine disorder; toxic myopathy; mental disorder; hypothyroidism; glaucoma; sensorineural disorder; ansemia; epilepsy; transgenic animal. Proteins ABR52568-ABR53003 and ACC66010-ACC61944 respectively. The complexes are obtainable by using a protein as a bait and isolating the set of proteins which is attached thereto from cells. Such protein complexes may comprise up to 30 distinct proteins. Protein complexes of the invention are useful for diagnosing a disease or disorder, or as a target for an active agent of a pharmaceutical, preferably a drug target in the treatment or prevention of a disease or disorder. Note: The sequence data for this patent is not represented in the printed specification, but is based on sequence information supplied by the European Patent Office. The complete

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.

Example 1; Page 30; 68pp; English.

The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAY79953, and AAX91201 to AAX91252, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAZ91201 to AAZ91202, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                       ö
                                                                                                                                                                                                                            The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein Ps (MOMP Ps) of non-typeable H. influencase (ntill.) Each of these peptides contain an LB1 (f) peptide which is a 19 amino acid peptide derived from the sequence of WOMP Ps from strain ntHill28, representing amino acids Argl17 to G1913. This peptide represents the third exposed loop of Ps and is a potential B cell epitope. The loops of the invention are modified in terms of behing in a non-native environment in the recombinant outer membrane protein. The modified MOMP Ps may be used to induce an immune response in a mammal to prevent or treat Haemophilus sinfluenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                    Recombinant bacterial outer membrane protein where one or more surface-exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           surface exposed loop; major outer membrane protein P5; MOMP P5;

Haemophilus influenza.
                                                                                                                                                                                                                                                                                                         The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein PS (MOMP PS) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LBI(F) peptide which is a 19 amno acid peptide derived from the sequence of MOMP PS from strain ntHill28, representing amino acids Argl17 to Glyl35. This peptide represents the third exposed loop of PS and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP PS may be used to induce an immune response in a mammal to prevent or treat Haemophilus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Vaccine, non-typeable Haemophilus influenzae; ntHi; infection; chimeric procein; Haemophilus influenzae; PS-like fimbrin procein; lipoprocein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                 Recombinant bacterial outer membrane protein where one or more surface exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as ocitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV71955 to AAY7993, and AAX21201 to AAX21202. represent sequences used in the exemplification of the present invention
                                               otitis media, sinusitis, conjunctivitis, or lower respiratory, but infection. The peptides may also be used in vaccines against H. Influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for disgnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ01252, represent sequences used in the exemplification of

                                                                                                                                                                                                                                                                         Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                             The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ91251, represent sequences used in the exemplification of the present invention

                                                                                                                 The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused vis a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a H. influenzae fimbrin peptide used to generate the chimeric peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      The invention relates to a synthetic chimeric fimbrin peptide. The peptide is useful for treating a non-typable Haemophilus influenzae (NTH1) inflection and otitis media. The synthetic peptides do not require tedious purification techniques. The present sequence represents the amino acid sequence of H. influenzáe fimbrin subunit peptide #1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Synthetic chimeric fimbrin peptide, useful for treating Haemophilus influenzae infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                              ö

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAX79953, and AAX91201 to AAX91252, represent sequences used in the exemplification of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The invention relates to a synthetic chimaeric fimbrin peptide LB1 or LB2 comprises a first peptide unit derived from H. influenzae fimbrin, a second peptide unit containing a real epitope and a third linker peptide which connects the first peptide to the second. The chimaeric peptide is useful for inducing an immune response in animals against non-typable Haemophilus influenzae (NTHi) and for preventing or reducing adherence of NTHi to host cells thereby preventing or reducing the severity of ottits media. The present sequence is an H. influenzae fimbrin peptide for use in the chimaeric peptides of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Novel synthetic chimeric fimbrin peptide LB1 or LB2 comprising a first peptide unit, T cell epitope as second peptide unit and third linker peptide unit, useful for preventing or reducing severity of otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Gaps

                                                                                                                                                                                                                                                                                                         ö
                                                                                                             Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                      The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. Influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAZ91201 to AAZ91202, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  antigenic P5-like fimbrin subunit peptides used in vaccines against

Haemophilus influenza.
                                                                    peptides (LBI(f) peptides) of 5-like finhrin proteins from various Haemophilus influenzes strains. The peptides are used for diagnosis, Haemophilus influenzes estrains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzes infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAX79993, and AAX91201 to AAX91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79993, and AAS91201 to AAZ91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vaccine, non-typeable Haemophilus influenzae; ntH1; infection, chimeric protein, Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            aB
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present invention describes antigenic P5-like fimbrin subunit peptides (Lalif) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                             present invention describes antigenic P5-like fimbrin subunit

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes antigenic PS-like fimbrin subunit peptides (LB1(f) peptides) of PS-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY19955 to AAY7993, and AAZ91201 to AAZ91202, represent sequences used in the exemplification of the present invention

The present invention describes antigenic P5-like fimbrin subunit peptides (LBI(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. influenzae and probes from the present invention can be used for diagnosis of H. influenzae infection. AAV719955 to AAV77993, and AAS91201 to AAA291252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Vaccine, non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; citis media; sinusitis; conjunctivitis; lower respiratory tract infection.

                                                                                                                                  Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                            The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection.                                                                                                                                                                                                                      The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein Ps (MOMP Ps) of non-typeable H. influencase (ntth). Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide derived from the sequence of MOMP Ps from strain ntHill28, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of Ps and is a potential Bejitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP Ps may be used to induce an immune response in a mammal to prevent or treat Haemophilus influencase infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
Recombinant bacterial outer membrane protein where one or more surface-
exposed loops are modified is useful as a vaccine to prevent or treat
Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Immunoglobulin E; IgE; immunogenic; immunogen; Protein D; carrier; prostate cancer; Haemophilus influenzae; vaccine; infectious disease; malaria; cytostatic; antiallergic; nootropic; neuroprotective; protozoacide; Alzheimer's disease; allergy.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            ò
                                             The present invention describes an immunogen (I) comprising a peptide

(Ia) and a carrier (Ib) derived from protein D of Haemophilus influenzae

or its fragment. Also described are: (I) a vaccine comprising (I), and an

excipient; (2) preparation of (I), comprising conjugating a peptide to

protein D or its fragment; and (3) preparation of a vaccine of (I),

comprising formulating (I) with an excipient: (I) has cytostatic,

antiallergic, nootropic, neuroprotective and protozoacide activities. (I)

preventing and treating infectious diseases such as medicament for

preventing and treating infectious diseases such as malaria or chronic

preventing and treating infectious disease or allergy in a patient.

Onlike prior art immunogens, (I) induces high levels of antipeptide

immune responses while inducing a moderate humoral response against the

carrier. The present sequence represents an LBIGIT peptide which was

coupled through an additional C-terminal cysteine via maleimide to

protein D in an example from the present invention
                                                                                                                                                                                                                                                                                                                            ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The sequences given in AAB47439-46 represent peptides which may be used to replace one or more surface exposed loops of major outer membrane protein P5 (MOMP P5) of non-typeable H. influenzae (ntHi). Each of these peptides contain an LB1(f) peptide which is a 19 amino acid peptide
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Recombinant bacterial outer membrane protein where one or more surface exposed loops are modified is useful as a vaccine to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis
                                                                                                                                                                                                                                                                                                                              Gaps
comprises peptide and carrier from protein D of influenzae
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          surface exposed loop; major outer membrane protein P5; MOMP P5;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to the manufacture of a synthetic chimeric peptide comprising a non-typable Haemophilus influenzae fimbrin peptide fused via a linker peptide to a T-cell epitope peptide. The chimeric peptide is used in immunogenic compositions which induce an immune response against non-typable Haemophilus influenzae. This sequence represents an example of a chimeric fimbrin/T-cell epitope peptide and is designated LBI. The peptide comprises a 19 amino acid sequence corresponding to amino acids 117-135 of the fimbrin protein, the linker sequence and amino acid 288-302 of the measles virus fusion protein (a T-cell epitope)
derived from the sequence of MOMP P5 from strain ntHill128, representing amino acids Argl17 to Gly135. This peptide represents the third exposed loop of P5 and is a potential B cell epitope. The loops of the invention are modified in terms of being in a non-native environment in the recombinant outer membrane protein. The modified MOMP P5 may be used to induce an immune response in a mammal to prevent or treat Haemophilus influenzae infection or associated disease, e.g., otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Synthetic chimeric fimbrin peptide - useful for vaccination against non-
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Chimeric; non-typable Haemophilus influenzae; fimbrin; T-cell epitope; immunogenic composition; immune response.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Gaps

```
The invention relates to a synthetic chimeric fimbrin peptide. The peptide is useful for treating a non-typable Haemophilus influenzae (NTH1) inflection and otitis media. The synthetic peptides do not require tedious purification techniques. The present sequence represents the amino acid sequence of the chimeric fimbrin peptide LB1.
                                                                                                                                                                                                                                                                                                                                                    Synthetic chimeric fimbrin peptide, useful for treating Haemophilus

    H. influenzae fimbrin peptide/T cell epitope chimaera LB1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The present invention describes antigenic P5-like fimbrin subunit peptides (LBJ(f) peptides) of P5-like fimbrin proceins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAX79993, and AAZ31201 to AAZ91205, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                             Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        ö

                                                                                                                                                                                           ò
                                                                                                                                                                                                                                              ö
                                                                               The invention relates to a synthetic chimaeric fimbrin peptide LB1 or LB2 comprises a first peptide unit derived from H. influenzae fimbrin, a second peptide unit containing a r cell epitope and a third linker peptide which connects the first peptide to the second. The chimaeric peptide which connects the first peptide to the second. The chimaeric peptide is useful for inducing an immune response in animals against non-typable Haemophilus influenzae (NTHI) and for preventing or reducing adherence of NTHI to host cells thereby preventing or reducing the severity of otitis media. The present sequence is an H. influenzae fimbrin peptide/measles virus T cell epitope chimaeric peptide of the
                  Novel synthetic chimeric fimbrin peptide LB1 or LB2 comprising a first peptide unit, T cell epitope as second peptide unit and third linker peptide unit, useful for preventing or reducing severity of otitis media.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vaccine comprising non-typable Haemophilus influenza fimbrin protein - useful in studying, preventing or reducing the severity of otitis media, also fimbrin protein and DNA.

clinical isolates of Haemophilus influenzae share common epitopes. Thus frimbrin isolated from non-typable Haemophilus influenzae 1128 strain is a particularly suitable immunogen to protect against the different non-typable HJ. influenzae that cause otilis media. Fimbrin protein is produced by culturing a transformed microbial host, pref. B.coli, Sporodoptera frugiperda or a mucosal pathogen. Fimbrin protein (FP) produced by this process is claimed. The FP protein migrates in polyacrylamide genes to a posn. equiv. to a mol. wt. of 25.5 kD or 37.5 kD. (Updated on 25-MAR-2003 to correct PN field.) (Updated on 25-MAR-2003 to correct COS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               New antisense nucleic acids, useful for identifying proteins or screening for homologous nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the 6213 antisense sequences given in the specification where expression of the nucleic acid inhibits proliferation of a cell, Also included are:
(1) a vector comprising a promoter operably linked to the nucleic acid encoding a polypeptide whose expression is inhibited by the antisense nucleic acid; (2) a host cell containing the vector; (3) an isolated polypeptide or its fragment whose expression is inhibited by the antisense autisense nucleic acid; (4) an antibody capable of specifically binding the polypeptide; (6) inhibiting cellular proliferation or the activity of a gene in an operon required for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The invention relates to an isolated nucleic acid comprising any one of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Antisense; prokaryotic essential gene; cell proliferation; drug design.

proliferation, (7) identifying a compound that influences the activity of the gene product or that has an activity against a biological pathway crequired for proliferation, or that inhibite callular proliferation, (8) identifying a gene required for callular proliferation or the biological pathway in which a proliferation-required gene or its gene product lies or a gene on which the test compound that inhibits proliferation of an compound's activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the exent compound is activity; (11) a culture comprising strains in which the gene product is overexpressed or underexpressed; (12) determining the exent compount is overeance or collection of strains; or (13) identifying the target of a compound that inhibits the proliferation of an organism. The antisense nucleic acids required for cellular proliferation to isolate candidate molecules for rational drug discovery programs, or for screening homologous nucleic acids required for proliferation in cells other than S. aureus, S. irphimurium, required for proliferation in cells other than S. aureus, S. irphimurium,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö
                                                                                                                                                                                                                                                                                                                       K. pneumoniae or P. aeruginosa. The present sequence is encoded by one of the target prokaryotic essential genes. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO at ftp.wipo.int/pub/published_pct_sequences
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Haemophilus influenzae; P5-like fimbrin protein; 11poprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis,
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   .

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for disgnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae, Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79933, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                          Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                                                                                                                                                                                                                                                                      The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY79931, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAX91252, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Vaccine, non-typeable Haemophilus influenzae, ntHi, infection, chimeric protein, Haemophilus influenzae, P5-like fimbrin protein, lipoprotein D, LBI(f), immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                   Vaccine, non-typeable Haemophilus influenzae, ntHi; infection; chimeric protein; Haemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otitis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   ö

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                   The present invention describes antigenic PS-like fimbrin subunit peptides (LB1(f) peptides) of PS-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAX79993, and AAX9101 to AAX91252, represent sequences used in the exemplification of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          The present invention describes antigenic P5-like fimbrin subunit peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAX79993, and AAZ91201 to AAZ91252, represent sequences used in the exemplification of the present invention

Novel antigenic P5-like fimbrin subunit peptides used in vaccines against
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 peptides (LB1(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, simusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAX79955 to AAX79993, and AAX912101 to AAX91252, represent sequences used in the exemplification of the present invention
                                                                                                                                               Vaccine; non-typeable Haemophilus influenzae; ntHi; infection; chimeric protein; Hemophilus influenzae; PS-like fimbrin protein; lipoprotein D; LB1(f); immunogenic; antigenic; otltis media; sinusitis; conjunctivitis; lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Vaccine, non-typeable Haemophilus influenzae, ntHi, infection, chimeric protein, Haemophilus influenzae, P5-like fimbrin protein, lipoprotein D; LB1(f), immunogenic, antigenic, otitis media, sinusitis, conjunctivitis, lower respiratory tract infection.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   present invention describes antigenic P5-like fimbrin subunit
                                                                                                              Non-typeable H. influenzae group 1 LB1(f) peptide N1848NP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Non-typeable H. influenzae group 1 LB1(f) peptide N214NP.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Score 42; DB 3;

The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections, such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract infection. The peptides may also be used in vaccines against H. influenzae, Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection.                                                                                                                                                                                                                                                                                                                              ö
                                                                                                                                           Novel antigenic P5-like fimbrin subunit peptides used in vaccines against Haemophilus influenza.
                                                                                                                                                                                 The present invention describes antigenic P5-like fimbrin subunit peptides (LBI(f) peptides) of P5-like fimbrin proteins from various Haemophilus influenzae strains. The peptides are used for diagnosis, prevention, and treatment of Haemophilus influenzae infections such as otitis media, sinusitis, conjunctivitis, or lower respiratory tract influenzae. Antibodies may also be used in vaccines against H. Influenzae. Antibodies and probes from the present invention can be used for diagnosis of H. influenzae infection. AAY79955 to AAY7993, and AAZ91201 to AAZ91202, represent sequences used in the exemplification of the present invention
                                                                                                                                                                                                                                                                                                                             Gaps

The present invention describes an isolated polymucleotide (I) of Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. Alloiococcus otitidis genomic DNA, which encodes an antigenic protein. CC Alloiococcus otitidis is a gram-positive bacterium. Also described: (i) an isolated polypeptide that is encoded by the polymucleotide (I), its complement, degenerate variant or fragment; (3) a genetically engineered to composition comprising the novel isolated polymucleotide (I), its composition comprising the polypeptide of (I); (5) an immunogenic composition comprising the polypeptide of (I); (5) an immunogenic equivalent or fragment, or the polymucleotide that is comprising the expression vector; (6) apharmaceutical composition comprising in the expression vector; (6) and a carrier; (7) a protein chip comprising the copypeptide of (I), their biological equivalent or fragment; (8) immunogenic composition; (9) detecting and/or identifying Alloiococcus oritidis by administering to a host the immunogenic composition; (9) detecting and/or identifying Alloiococcus oritidis in the biological sample; (I0) a kit comprising an orituring the containing the novel polymucleotide, its degenerate variant or fragment, or the antibody of (4); and (11) producing a polypeptide by culturing the polymucleotides, polypeptides, antibodies and compositions of the present polymucleotides, polypeptides, antibodies and compositions of the present invention can be used for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials. The polymucleotides expressing and detecting Alloiococcus otitidis. The polymucleotides expressing and Alloiococcus otitidis.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ö
New Alloiococcus otitidis polynucleotides and polypeptides, useful for treating and diagnosing diseases, drug screening assays and monitoring of effects during drug clinical trials.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "amino acid at position 195 is not identified in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    /nore= "amino acid at position 311 is not identified in the specification"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Gape
